Carsten Flensburg

Wed, 12/08/2004 (All day)

This issue features a great new utility from Carsten Flensburg. This time he's provided a very nice utility to easily delve deeply into the system maintained attributes of IFS files and folders.

Here's the DSPATR (Display Attribute) utility. It presents information similar to the WRKLNK (Work with Links) command's option 8 -- plus some extra attributes, e.g. object creation date, authorization list, and primary group. And it allows you to print the information, which the WRKLNK option doesn't. The number of attributes available will vary by object type.

The following source code is included:

```
CBX927 -- command CPP(Command Processing Program) CBX927X -- command definition  
CBX927V -- command VCP (Validity Checking Program) CBX927H -- command help panel group
```

See each source member for compile instructions.

You can download a zip file containing all the source code from

<http://www2.systeminetwork.com/noderesources/code/clubtechcode/DspAtr.zip>.

Editors Note: I have been very impressed by Carsten's great coding style. I suggest that you share his code with those in your development group for their education.
