Automatic Notification When Spool Files Created

[System iNetwork Systems Management Newsletter](#)

Chuck Lundgren

Wed, 03/17/2004 (All day)

This issue's utility by Carsten Flensburg enables you to automatically send a message to a user whenever a spool file is created by a job run by that user.

Utility CBX909 shows how to use an environment variable, a data queue, and a data queue entry processing program to send a message each time a spool file is created. Once you've configured the data queue and environment variable, data queue entries will be generated for one or more individual jobs or for the entire system whenever a spool file is created. Program CBX909 processes those data queue entries and sends a message to the user profile that created the spool file.

The instructions on how to create the data queue and environment variable and compile the program are included in program CBX909 comments.

You can download the job performance information utility here:
